### 3 Introduction

The following document details the Module Interface Specifications for TTE RecSys

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/V-AS/Two-tower-recommender-system>

### 4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003).

The following table summarizes the primitive data types used by TTE RecSys.

Data Type	Notation	Description
character	char	A sequence of characters
Array	$[T]$	A sequence of elements of type $T$
Matrix	$[T]^{m \times n}$	A 2D array of type $T$ with $m$ rows and $n$ columns
Boolean	$\mathbb{B}$	True or False value
Integer	$\mathbb{Z}$	A number without a fractional component in $(-\infty, \infty)$
real	$\mathbb{R}$	Any number in $(-\infty, \infty)$

TTE RecSys uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

The specification also uses derived data types:

- Embedding: A vector of real numbers
- Tensors: Multi-dimensional arrays
- User: A type representing user features
- Item: A type representing item features

### 5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding Module	
	Data Processing Module
	Model Training Module
	Embedding Generation Module
Behaviour-Hiding Module	Recommendation Module
Software Decision Module	Neural Network Architecture Module
	ANN Search Module
	Vector Operations Module

Table 1: Module Hierarchy

## 6 MIS of Hardware-Hiding Module

### 6.1 Module

SystemInterface

### 6.2 Uses

None

### 6.3 Syntax

#### 6.3.1 Exported Constants

None

#### 6.3.2 Exported Access Programs

Name	In	Out	Exceptions
save_model	model: Model, path: String	success: $\mathbb{B}$	IOError
load_model	path: String	model: Model	IOError, FormatError
save_emds	embeddings: [Embedding], path: String	success: $\mathbb{B}$	IOError
load_emds	path: String	embeddings: [Embedding]	IOError

### 6.4 Semantics

#### 6.4.1 State Variables

None

#### 6.4.2 Environment Variables

FileSystem: The file system where models and embeddings are stored

#### 6.4.3 Assumptions

- The file system is accessible and has sufficient space
- The paths provided are valid

#### 6.4.4 Access Routine Semantics

save\_model(model, path):

- output: success = true if operation succeeds
- exception: IOError if file cannot be written

load\_model(path):

- output: model
- exception: IOError if file cannot be read, FormatError if file format is invalid

save\_embeddings(embeddings, path):

- output: success = true if operation succeeds
- exception: IOError if file cannot be written

oad\_embeddings(path):

- output: embeddings
- exception: IOError if file cannot be read, FormatError if file format is invalid

## 7 MIS of Data Processing Module

### 7.1 Module

DataProcessor

### 7.2 Uses

SystemInterface

### 7.3 Syntax

#### 7.3.1 Exported Constants

None

#### 7.3.2 Exported Access Programs

Name	In	Out	Exceptions
load_data	path: String	data: DataSet	IOError, FormatError
validate_data	data: DataSet	is_valid: $\mathbb{B}$	-
prep_data	data: DataSet	processed_dataset	-
split_data	data: DataSet, train_ratio: $\mathbb{R}$	train_data: DataSet, test_data: DataSet	IOError

## 7.4 Semantics

### 7.4.1 State Variables

None

### 7.4.2 Environment Variables

None

### 7.4.3 Assumptions

- Input data follows the expected schema

### 7.4.4 Access Routine Semantics

`load_data(path):`

- `data` = parsed data from file at `path`
- exception: `IOError` if file cannot be read, `FormatError` if file format is invalid

`validate_data(data)::`

- output: `is_valid` = true if data meets all validation criteria

`preprocess_data(data):`

- output: `processed_data` = dataset after applying preprocessing transformations

`split_data(data, train_ratio):`

- output: (`train_data`, `test_data`) where:
  - `train_data` = subset of data for training (size  $\approx$  `train_ratio` \*  $|data|$ )
  - `test_data` = subset of data for training (size  $\approx$  (1-`train_ratio`) \*  $|data|$ )
- exception: `ValueError` if `train_ratio` is not in (0, 1)

## 8 MIS of Model Training Module

### 8.1 Module

`ModelTrainer`

### 8.2 Uses

`DataProcessor`, `NeuralNetworkArchitecture`, `VectorOperations`

## 8.3 Syntax

### 8.3.1 Exported Constants

DEFAULT\_LEARNING\_RATE = 0.01

DEFAULT\_BATCH\_SIZE = 128

DEFAULT\_REGULARIZATION = 0.01

### 8.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	config: TrainingCon- fig	-	ValueError
train	train_data: DataSet, epochs: $\mathbb{Z}$	model: Model	IOError, FormatError
evaluate	test_data: DataSet,	metrics: Evaluation- Metrics	-
get_user_model	-	user_model: Model	NotInitializedError
get_item_model	-	item_model: Model	NotInitializedError

## 8.4 Semantics

### 8.4.1 State Variables

- UserModel: The neural network model for the user tower
- ItemModel: The neural network model for the item tower
- IsInitialized: Boolean indicating if the module has been initialized

### 8.4.2 Environment Variables

None

### 8.4.3 Assumptions

- The training data is preprocessed and valid
- The model configuration is valid

### 8.4.4 Access Routine Semantics

initialize(config):

- transition:

- UserModel = create\_user\_model(config.user\_architecture)
- ItemModel = create\_item\_model(config.item\_architecture)
- IsInitialized = true

- exception: ValueError if config contains invalid parameters

train(train\_data, epochs):

- transition:
  - Update UserModel and ItemModel parameters through training
- output: history = record of loss values and metrics during training
- exception: NotInitializedError if IsInitialized is false

evaluate(test\_data):

- output: metrics = evaluation metrics on test data
- exception: NotInitializedError if IsInitialized is false

get\_user\_model():

- output: user\_model = UserModel
- exception: NotInitializedError if IsInitialized is false

get\_item\_model():

- output: item\_model = UserModel
- exception: NotInitializedError if IsInitialized is false

#### 8.4.5 Local Functions

compute\_loss(user\_embeddings, item\_embeddings, ratings):

- Type:  $[\mathbb{R}^k] \times \mathbb{R}^k \times \mathbb{R}$
- Description: Computes MSE loss between predicted and actual ratings

## 9 MIS of Embedding Generation Module

### 9.1 Module

EmbeddingGenerator

## 9.2 Uses

NeuralNetworkArchitecture, VectorOperations

## 9.3 Syntax

### 9.3.1 Exported Constants

EMBEDDING\_DIMENSION = 128

### 9.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	user_model: Model,item_model: Model	-	ValueError
generate_user_embedding	users: [ProcessedUser]	embeddings: [Embedding]	NotInitializedError
generate_item_embedding	items: [ProcessedItem]	[Pro- embeddings: [Embedding]	NotInitializedError

## 9.4 Semantics

### 9.4.1 State Variables

- UserModel: The neural network model for the user tower
- ItemModel: The neural network model for the item tower
- IsInitialized: Boolean indicating if the module has been initialized

### 9.4.2 Environment Variables

None

### 9.4.3 Assumptions

- The models have been trained

### 9.4.4 Access Routine Semantics

initialize(user\_model, item\_model):

- transition:
  - UserModel = user\_model

- ItemModel = item\_model
- IsInitialized = true

- exception: ValueError if models are incompatible

generate\_user\_embedding(users):

- output: embeddings := [UserModel(user) for user in users]
- exception: NotInitializedError if IsInitialized is false

generate\_item\_embedding(items):

- output: embeddings := [ItemModel(item) for item in items]
- exception: NotInitializedError if IsInitialized is false

## 10 MIS of Recommendation Module

### 10.1 Module

Recommender

### 10.2 Uses

EmbeddingGenerator, ANNSearch, VectorOperations

### 10.3 Syntax

#### 10.3.1 Exported Constants

DEFAULT\_NUM\_RECOMMENDATIONS = 10 SIMILARITY\_THRESHOLD = 0.5

#### 10.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	ann_index : ANNIndex	-	ValueError
get_recommendations	user: ProcessedUser, num_results: $\mathbb{Z}$	recommendations: [Recommendation]	NotInitializedError, FormatError
evaluate_rec	test_data: DataSet, path: String	metrics: RecommendationMetrics	NotInitializedError

## 10.4 Semantics

### 10.4.1 State Variables

ANNIndex: The index for approximate nearest neighbor search  
EmbeddingGen: Reference to the embedding generator  
IsInitialized: Boolean indicating if the module has been initialized

### 10.4.2 Environment Variables

None

### 10.4.3 Assumptions

- The ANN index has been built with item embeddings
- The embedding generator has been initialized with trained models

### 10.4.4 Access Routine Semantics

initialize(ann\_index):

- transition:
  - ANNIndex = ann\_index
  - IsInitialized = true
- exception: ValueError if ann\_index is invalid

get\_recommendations(user, num\_results):

- output: recommendations = ranked list of recommended items with similarity scores
- exception: NotInitializedError if IsInitialized is false

evaluate\_recommendations(test\_data):

- output: metrics = evaluation metrics for recommendations
- exception: NotInitializedError if IsInitialized is false

### 10.4.5 Local Functions

rank\_candidates(user\_embedding, candidate\_embeddings):

- Description: Ranks candidates by similarity score (dot product)
- Type:  $\mathbb{R}^k \times [\mathbb{R}^k] \rightarrow [(\mathbb{Z}, \mathbb{R})]$

# 11 MIS of Neural Network Architecture Module

## 11.1 Module

NeuralNetworkArchitecture

## 11.2 Uses

VectorOperations

## 11.3 Syntax

### 11.3.1 Exported Constants

DEFAULT\_HIDDEN\_LAYERS = [256, 128] DEFAULT\_ACTIVATION = "relu"

### 11.3.2 Exported Access Programs

Name	In	Out	Exceptions
create_user_tower	input_dim: $\mathbb{Z}$ , hidden_layers: [ $\mathbb{Z}$ ] , embedding_dim: $\mathbb{Z}$	model: Model	ValueError
create_item_tower	input_dim: $\mathbb{Z}$ , hidden_layers: [ $\mathbb{Z}$ ] , embedding_dim: $\mathbb{Z}$	model: Model	ValueError
get_layer_config	model: Model	config: LayerConfig	ValueError

## 11.4 Semantics

### 11.4.1 State Variables

None

### 11.4.2 Environment Variables

None

### 11.4.3 Assumptions

None

### 11.4.4 Access Routine Semantics

create\_user\_tower(input\_dim, hidden\_layers, embedding\_dim):

- output: model = neural network model for user tower

- exception: ValueError if dimensions are invalid

create\_item\_tower(input\_dim, hidden\_layers, embedding\_dim):

- output: model = neural network model for item tower
- exception: ValueError if dimensions are invalid

get\_layer\_config(model):

- output: config := configuration of layers in the model
- exception: ValueError if model is invalid

## 12 MIS of ANN Search Module

### 12.1 Module

ANNSearch

### 12.2 Uses

VectorOperations

### 12.3 Syntax

#### 12.3.1 Exported Constants

DEFAULT\_SEARCH\_NPROBE := 10 DEFAULT\_INDEX\_TYPE := "IVF"

#### 12.3.2 Exported Access Programs

Name	In	Out	Exceptions
build_index	embeddings: [Embedding] , item_ids: [ $\mathbb{Z}$ ], index_type: String	index: ANNIndex	ValueError
search	index: ANNIndex, query: Embedding, k: $\mathbb{Z}$	results: [ $(\mathbb{Z}, \mathbb{R})$ ]	ValueError
save_index	index: ANNIndex, path: String	success: $\mathbb{B}$	IOError
load_index	path: String	index: ANNIndex	IOError, FormatError

## 12.4 Semantics

### 12.4.1 State Variables

None

### 12.4.2 Environment Variables

None

### 12.4.3 Assumptions

- Embeddings are of consistent dimension
- Query vector is of same dimension as indexed vectors

### 12.4.4 Access Routine Semantics

`build_index(embeddings, item_ids, index_type):`

- output: `index` = ANN index built from embeddings and associated item IDs
- exception: `ValueError` if parameters are invalid

`search(index, query, k):`

- output: `results` = list of `(item_id, similarity_score)` tuples for `k` nearest neighbors
- exception: `ValueError` if parameters are invalid

`save_index(index, path):`

- output: `success := true` if operation succeeds
- exception: `IOError` if file cannot be written

`load_index(path):`

- output: `index := ANNIndex` loaded from file
- exception: `IOError` if file cannot be read, `FormatError` if file format is invalid

## 13 MIS of Vector Operations Module

### 13.1 Module

`VectorOperations`

## 13.2 Uses

None

## 13.3 Syntax

### 13.3.1 Exported Constants

EPSILON := 1e-8 (small value to prevent division by zero)

### 13.3.2 Exported Access Programs

Name	In	Out	Exceptions
dot_product	v1: $[\mathbb{R}]$ , v2: $[\mathbb{R}]$	result: $\mathbb{R}$	DimensionMismatchError

## 13.4 Semantics

### 13.4.1 State Variables

None

### 13.4.2 Environment Variables

None

### 13.4.3 Assumptions

None

### 13.4.4 Access Routine Semantics

dot\_product(v1, v2):

- output: result =  $\sum_i^{len(v1)} v1[i] * v2[i]$
- exception: DimensionMismatchError if  $len(v1) \neq len(v2)$
