3 Introduction

The following document details the Module Interface Specifications for TTE RecSys, a two-tower recommendation system. The system leverages deep learning to create both the user tower and item tower, mapping inputs to a shared embedding space. Then, an effective algorithm is used to select a large number of candidate items. Finally, the dot product is applied for a refined ranking of the candidate items, returning the final recommendations accordingly.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at https://github.com/V-AS/Two-tower-recommender-system

4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003).

The following table summarizes the primitive data types used by TTE RecSys.

Data Type	Notation	Description	
Character	char	A single character	
String	string	A sequence of characters representing text	
Array	[T]	A sequence of elements of type T	
Dictionary/Map	dict	A Python dictionary	
Vector	\mathbb{R}^n	An ordered collection of n real numbers	
Matrix	$[T]^{m \times n}$	A 2D array of type T with m rows and n	
		columns	
Boolean	\mathbb{B}	True or False value	
Integer	$\mathbb Z$	A number without a fractional component	
		in $(-\infty, \infty)$	
Real	\mathbb{R}	Any number in $(-\infty, \infty)$	
Tuple	(T_1, T_2, \ldots)	An ordered collection of elements with	
		possibly different types	

TTE RecSys uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification. The specification also uses derived data types:

- Embedding: A vector of real numbers representing learned features.
- **Tensor**: A multi-dimensional array, used for numerical computations.

- DataFrame: A two-dimensional array-like structure with labeled axes (rows and columns), typically used for storing tabular data.
- Dataset: A collection of data used for training or testing machine learning models.
- User Feature: A dictionary where the key is a string and the value is the corresponding feature value for the user.
- **Item Feature**: A dictionary where the key is a string and the value is the corresponding feature value for the item.
- Model: A neural network used for learning user and item representations.
- **ANNIndex**: A data structure used for approximate nearest neighbor search in embedding space.
- EvaluationMetrics: A dictionary mapping evaluation metric names (strings) to their computed values (e.g., accuracy, RMSE).
- **TrainingConfig**: A dictionary containing configuration parameters for model training.
- FormatError: An exception raised when a file has an incorrect format.
- **DimensionMismatchError**: An exception raised when vectors of incompatible dimensions are used in operations.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding Module	
Behaviour-Hiding Module	System Interface Module Data Processing Module Model Training Module Embedding Generation Module Recommendation Module
Software Decision Module	Neural Network Architecture Module ANN Search Module Vector Operations Module

Table 1: Module Hierarchy

6 MIS of System Interface Module

6.1 Module

SystemInterface

6.2 Uses

None

6.3 Syntax

6.3.1 Exported Constants

None

6.3.2 Exported Access Programs

Name	In	Out	Exceptions
save_model	model: Model, path:	\mathbb{B}	IOError
	String		
load_model	path: String	Model	IOError,
			FormatError
save_emds	embeddings: [Embed-	\mathbb{B}	IOError
	ding ,		
	path: String		
load_emds	path: String	[Embedding]	IOError
save_training_history	history: Dictionary,	\mathbb{B}	IOError
	path: String		
load_training_history	path: String	Dictionary	IOError,
			FormatError

6.4 Semantics

6.4.1 State Variables

None

6.4.2 Environment Variables

FileSystem: The file system where models and embeddings are stored

6.4.3 Assumptions

- The file system is accessible and has sufficient space
- The paths provided are valid

6.4.4 Access Routine Semantics

save_model(model, path):

- output: True if success, False otherwise
- exception: IOError if file cannot be written

load_model(path):

- output: Model
- exception: IOError if file cannot be read, FormatError if file format is invalid save_emds(embeddings, path):
 - output: True if success, False otherwise
 - exception: IOError if file cannot be written

load_embeddings(path):

- output: [Embedding]
- exception: IOError if file cannot be read, FormatError if file format is invalid save_training_history(history, path):
 - output: True if success, False otherwise
 - exception: IOError if file cannot be written

load_training_history(path):

- output: Dictionary where keys are strings representing metrics ('loss', 'accuracy', etc.) and values are lists of corresponding numeric values for each training epoch
- exception: IOError if file cannot be read, FormatError if file format is invalid

7 MIS of Data Processing Module

7.1 Module

DataProcessor

7.2 Uses

SystemInterface

7.3 Syntax

7.3.1 Exported Constants

None

7.3.2 Exported Access Programs

Name	In	Out	Exceptions
load_data	path: String	DataFrame	IOError,
			FormatError
validate_data	data: DataFrame	\mathbb{B}	-
prep_data	data: DataFrame	DataFrame	-
split_data	data: DataFrame,	(DataFrame,	ValueError
	train_ratio: \mathbb{R}	DataFrame)	
create_training_data	data: DataFrame	Dictionary	ValueError
get_book_mapping	data: DataFrame	Dictionary	-

7.4 Semantics

7.4.1 State Variables

None

7.4.2 Environment Variables

None

7.4.3 Assumptions

• Input data follows the expected schema

7.4.4 Access Routine Semantics

load_data(path):

- output: DataFrame containing the data from the file at the specified path
- exception: IOError if the file cannot be read; FormatError if the file format is invalid validate_data(data):
- output: True if the data meets all validation criteria, False otherwise preprocess_data(data):
 - output: DataFrame containing the input data after applying normalization and feature creation

split_data(data, train_ratio):

- output: (DataFrame, DataFrame) representing training data and testing data
- exception: ValueError if train_ratio is not in (0,1)

create_training_data(data):

- output: Dictionary where keys are 'user_ids', 'item_ids', 'ratings', 'user_features', and 'item_features', and values are the corresponding arrays of user IDs, item IDs, rating values, user feature dictionaries, and item feature dictionaries
- exception: ValueError if required features are missing

get_book_mapping(data):

• output: Dictionary where each key is a book ID (\mathbb{Z}) and the value is a tuple of (String, String, \mathbb{Z} , String) representing the associated title, author, year, and publisher

8 MIS of Model Training Module

8.1 Module

ModelTrainer

8.2 Uses

DataProcessor, NeuralNetworkArchitecture, VectorOperations

8.3 Syntax

8.3.1 Exported Constants

DEFAULT_LEARNING_RATE = 0.001 DEFAULT_BATCH_SIZE = 64 DEFAULT_REGULARIZATION = 0.0001

8.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	config: TrainingCon-	-	ValueError
	fig		
train	train_data: Dataset,	Dictionary	RuntimeError
	epochs: \mathbb{Z}		
evaluate	test_data: Dataset	EvaluationMetrics	RuntimeError
get_user_model	-	Model	RuntimeError
get_item_model	-	Model	RuntimeError

8.4 Semantics

8.4.1 State Variables

• UserModel: The neural network model for the user

• ItemModel: The neural network model for the item

• IsInitialized: Boolean indicating if the module has been initialized

• Config: Training configuration parameters

• Optimizer: Optimization algorithm

• Device: Computation device (CPU/GPU)

8.4.2 Environment Variables

None

8.4.3 Assumptions

- The training data is preprocessed and valid
- The model configuration is valid

8.4.4 Access Routine Semantics

initialize(config):

- transition:
 - UserModel ← config['user_architecture']
 - ItemModel ← config['item_architecture']
 - Optimizer ← initialize optimization algorithm
 - IsInitialized \leftarrow True
- exception: ValueError if config contains invalid parameters train(train_data, epochs):
 - transition:
 - Use Optimizer to optimize the loss function of the user and item models
 - The loss is computed using the local function compute_loss
 - output: Dictionary where keys are strings 'loss', 'training_loss', and 'validation_loss', and values are list of real number.
- exception: RuntimeError if IsInitialized is false evaluate(test_data):
 - output: EvaluationMetrics computed on the test data
- exception: RuntimeError if IsInitialized is false get_user_model():
 - output: Model
- exception: RuntimeError if IsInitialized is false get_item_model():
 - output: Model
 - exception: RuntimeError if IsInitialized is false

8.4.5 Local Functions

compute_loss(user_embeddings, item_embeddings, ratings):

- Type: $[\mathbb{R}^k] \times [\mathbb{R}^k] \times [\mathbb{R}] \to \mathbb{R}$
- Description: Computes the mean squared error (MSE) loss between predicted and actual ratings

9 MIS of Embedding Generation Module

9.1 Module

EmbeddingGenerator

9.2 Uses

 $Neural Network Architecture,\ Vector Operations$

9.3 Syntax

9.3.1 Exported Constants

None

9.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	user_model:	-	ValueError
	Model, item_model:		
	Model		
generate_user_embedding	users: [User Feature]	[Embedding]	RuntimeError
generate_item_embedding	items: [Item Feature]	[Embedding]	RuntimeError

9.4 Semantics

9.4.1 State Variables

• UserModel: The neural network model for the user tower

• ItemModel: The neural network model for the item tower

• IsInitialized: Boolean indicating if the module has been initialized

• Device: Computation device (CPU/GPU)

9.4.2 Environment Variables

None

9.4.3 Assumptions

- The models have been trained
- User and item inputs have same dimensions

9.4.4 Access Routine Semantics

initialize(user_model, item_model):

- transition:
 - UserModel \leftarrow user_model
 - ItemModel \leftarrow item_model
 - IsInitialized \leftarrow true
 - Device ← detected available hardware (CPU or GPU)
- exception: ValueError if the models are incompatible generate_user_embedding(users):
 - output: [Embedding] for the provided user(s)
- exception: RuntimeError if IsInitialized is false generate_item_embedding(items):
 - output: [Embedding] for the provided item(s)
 - exception: RuntimeError if IsInitialized is false

10 MIS of Recommendation Module

10.1 Module

Recommender

10.2 Uses

EmbeddingGenerator, ANNSearch, VectorOperations

10.3 Syntax

10.3.1 Exported Constants

DEFAULT_NUM_RECOMMENDATIONS = 10 SIMILARITY_THRESHOLD = 0.5

10.3.2 Exported Access Programs

Name	In	Out	Exceptions
initialize	ann_index: ANNIn-	-	ValueError
	$\mathrm{dex},$		
	embedding_generator:		
	EmbeddingGenerator,		
	book_lookup: Dictio-		
	nary		
get_recommendations	user: User Feature,	$[(\mathbb{Z}, \operatorname{String}, \mathbb{R})]$	RuntimeError
	num_results: \mathbb{Z}		

10.4 Semantics

10.4.1 State Variables

ANNIndex: The index for approximate nearest neighbor search EmbeddingGenerator: Reference to the embedding generator BookLookup: Dictionary mapping item IDs to book details

IsInitialized: Boolean indicating if the module has been initialized

10.4.2 Environment Variables

None

10.4.3 Assumptions

- The ANN index has been built with item embeddings
- The embedding generator has been initialized with trained models
- The book lookup dictionary contains valid mappings

10.4.4 Access Routine Semantics

initialize(ann_index, embedding_generator, book_lookup):

- transition:
 - ANNIndex \leftarrow ann_index
 - $\ {\tt EmbeddingGenerator} \leftarrow {\tt embedding_generator}$
 - − BookLookup ← book_lookup
 - IsInitialized \leftarrow true
- exception: ValueError if any parameter is invalid

get_recommendations(user, num_results):

- output: $[(\mathbb{Z}, \text{String}, \mathbb{R})]$ representing a list of (item_id, item_title, similarity_score) tuples
- exception: RuntimeError if IsInitialized is false

10.4.5 Local Functions

rank_candidates(user_embedding, candidate_embeddings):

- Type: $\mathbb{R}^k \times [\mathbb{R}^k] \to [(\mathbb{Z}, \mathbb{R})]$
- Description: Ranks candidate items based on similarity scores computed using the dot product; returns a list of item indices with associated scores.

11 MIS of Neural Network Architecture Module

11.1 Module

NeuralNetworkArchitecture

11.2 Uses

VectorOperations

11.3 Syntax

11.3.1 Exported Constants

DEFAULT_HIDDEN_LAYERS = [256, 128]DEFAULT_ACTIVATION = "relu"

11.3.2 Exported Access Programs

Name	In	Out	Exceptions
create_user_tower	input_dim: \mathbb{Z} ,	Model	ValueError
	hidden_layers: $[\mathbb{Z}]$,		
	embedding_dim: \mathbb{Z}		
create_item_tower	input_dim: \mathbb{Z} ,	Model	ValueError
	hidden_layers: $[\mathbb{Z}]$,		
	embedding_dim: \mathbb{Z}		

11.4 Semantics

11.4.1 State Variables

None

11.4.2 Environment Variables

None

11.4.3 Assumptions

- Input dimensions are valid positive integers
- Hidden layers and embedding dimensions are compatible

11.4.4 Access Routine Semantics

create_user_tower(input_dim, hidden_layers, embedding_dim):

• output: Model for user tower

• exception: ValueError if dimensions are invalid

create_item_tower(input_dim, hidden_layers, embedding_dim):

• output: Model for item tower

• exception: ValueError if dimensions are invalid

12 MIS of ANN Search Module

12.1 Module

ANNSearch

12.2 Uses

VectorOperations

12.3 Syntax

12.3.1 Exported Constants

DEFAULT_SEARCH_NPROBE := 10 DEFAULT_INDEX_TYPE := "Flat"

12.3.2 Exported Access Programs

Name	In	Out	Exceptions
build_index	embeddings: [Embed-	ANNIndex	ValueError
	$\operatorname{ding}]$,		
	item_ids: $[\mathbb{Z}]$,		
	index_type: String		
two_stage_search	index: ANNIndex,	$[(\mathbb{Z},\mathbb{R})]$	ValueError
	query: Embedding,		
	candidates: \mathbb{Z} ,		
	final_k: \mathbb{Z}		
save_index	index: ANNIndex,	\mathbb{B}	IOError
	path: String		
load_index	path: String	ANNIndex	IOError,
			FormatError

12.4 Semantics

12.4.1 State Variables

None

12.4.2 Environment Variables

None

12.4.3 Assumptions

- Embeddings are of consistent dimension
- Query vector is of same dimension as indexed vectors
- FAISS library is available

12.4.4 Access Routine Semantics

build_index(embeddings, item_ids, index_type):

- output: ANNIndex
- exception: ValueError if any parameter is invalid

two_stage_search(index, query, candidates, final_k):

- output: $[(\mathbb{Z}, \mathbb{R})]$ representing a list of (item_id, similarity_score) pairs for the top-k nearest neighbors
- exception: ValueError if any parameter is invalid

save_index(index, path):

- output: True if success, False otherwise
- exception: IOError if the file cannot be written

load_index(path):

- output: ANNIndex
- exception: IOError if the file cannot be read; FormatError if the file format is invalid

13 MIS of Vector Operations Module

13.1 Module

VectorOperations

13.2 Uses

None

13.3 Syntax

13.3.1 Exported Constants

EPSILON := 1e-8 (small value to prevent division by zero)

13.3.2 Exported Access Programs

Name	In	Out	Exceptions
dot_product	v1: [R], v2: [R]	\mathbb{R}	DimensionMismatchError

13.4 Semantics

13.4.1 State Variables

None

13.4.2 Environment Variables

None

13.4.3 Assumptions

None

13.4.4 Access Routine Semantics

dot_product(v1, v2):

- output: \mathbb{R} representing $\sum_{i=1}^{n} v 1_i \cdot v 2_i$, where n is the number of elements in each vector
- exception: DimensionMismatchError if the input vectors do not have the same number of elements
